                                                                                                                                                             The present invention relates to novel single nucleotide polymorphisms (SNPs) in the human bone gamma carboxyglutamate protein (BGLAP) gene located on chromosome 1q25-q31, and methods for haplotyping and/or genotyping the BGLAP gene in an individual. The methods of the invention make use of allele-specific oligonucleotides (ASOs) as probes and primers and/or primer-extension oligonucleotides for detecting the BGLAP gene polymorphisms. The polynucleotides and screened compounds are useful for (developing) treatment of diseases associated with BGLAP polymorphic variant of the BGLAP protein (AANII0687).

Note: The present sequence is not given in the specification but is created by the indexer from the information given in the patent.

invention pertains to a method for expressing endogenous genes in differentiated cells of a specific type. The method involves contacting pluripotent stem cells capable of maturing into differentiated cells with a nucleic acid comprising an exogenous gene linked to a regulatory element capable of controlling expression of the exogenous gene in the differentiated cells. A population of transduced stem cells capable of maturing into differentiated cells expression to differentiated cells.
                                                                                                                                                                 Expression of exogenous genes in differentiated cells - by transducing pluripotent stem cells capable of maturing into differentiated cells with nucleic acid comprising exogenous
                                                                                                                                                                                                                                                                                                                                                                                                                                  gene

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates a beta-fructofuranosidase gene. The invetion is useful for the development of variant enzymes that have increased heat resistance and transfer ratio by means of genetic engineering techniques. Beta-fructofuranosidase is useful in the synthesis of transfructosylated oligosaccharides such as lactosucrose, for use in fields of foods and drugs.

                                (SNPs) in the human bone gamma carboxyglutamate protein (BGLAP) gene located on chromosome 1q25-q31, and methods for haplotyping and/or genotyping the BGLAP gene in an individual. The methods of the invention make use of allele-specific oligonucleotides (ASOs) as probes and primers and/or primer-extension oligonucleotides for detecting the BGLAP gene polymorphisms. The polynucleotides and screened compounds are useful for (developing) treatment of diseases associated with BGLAP activity, such as osteoporosis. The present sequence represents a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                differentiated cells are in a tissue of interest, such as bone or cartilage, and the exogenous gene is operably linked to at least on osteocalcin regulatory element derived from the hOC promoter. The exogenous gene can encode a therapeutic protein useful for treating a disease, especially osteoporosis, osteopenia, osteosarcoma,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               sequence (ABA90521) and related proteins (ABB53300-ABB55621). The nucleic acid sequence is useful in the detection and/or amplification nucleic acid sequence, particularly to identify Lactococcus lactis or related species. The proteins of the invention are useful for the biosynthesis or biodegradation of a composition of interest. The invention helps research in lactic bacteria

Claim 1; Page 64; 155pp; English

The present invention describes polypeptides (1), designated POLYX polypeptides (e.g. POLY1, POLY2, etc.), and the polynucleotide sequences (II) encoding them. POLY1-4 are members of the gamma aminobutyric acid (GABA) receptor family; POLY5-8 are members of the epidermal growth factor (EGF) family; POLY5-11 are members of the complement receptor family; POLY12 is a member of the haematopoletic stem and progenitor cell (HSPC) family; POLY13 is a member of the sulphotransferase family; POLY14-16 are members of the syntaxin family. and POLY17 is a member of the prohibitin family. (I) and (II) can have antidepressant, cerebroprotective, antiparkinsonian, nootropic, relaxant, anticonvulsant, neuroleptic, neuroprotective, antialcoholic, cardiant, tranquilliser and antiarrhythmic activities. (I) and (II) can be used for treating or preventing a POLYX-associated disorder in humans as a therapeutic in the manufacture of a medicament for treating a syndrome Tourette's syndrome, amyotrophic lateral sclerosis, head trauma, Alzheimer's disease, alcoholism, vigilance, anxiety muscle tension, epileptogenic activity and memory functions, cardiomyopathy and arrhythmogenic right ventricular dysplasia: The present sequence disorder, for treating a pathological state in a mammal, especially patients suffering from, e.g., psychiatric and medical conditions, depression, stroke, Parkinson's disease, Huntington's disease, associated with a human disease selected from a POLYX-associated represents POLY17 family;

The present invention also describes methods for identifying essential bacterial genes (i.e. those essential to the survival of a bacterium) using a transposition system. The methods are used to identify essential genes from bacteria, especially H. influenzae (which causes otitis media, meningitis and upper respiratory tract infections) which may be used as targets for potential antimicrobial agents.

AAF94410 to AAF94416 represent PCR primers used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           antiparasitic agent; insecticidal agent; microbial infection; mucous membrane infection; otitis media; sinusitis; bronchitis; alveolitis; conjunctivitis; pneumonia; meningitis; epiglottis; cellulitis; septic arthritis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      antiparasitic agent, insecticidal agent, and preventive antimicrobial agents which are effective in preventing microbial infection or useful in treatment of that particular infection. (1) and (II) may also be useful in treatment of mucous membrane infections such as otitis media, sinusitis, bronchitis, alveolitis, conjunctivitis, pneumonia, meningitis, epiglottis, cellulitis and septic arthritis. This is the amino acid sequence of an essential H. influenzae gene, described in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                     Arabidopsis

 ŏ
 Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

 Gen. Genet. 223:217-223(1990).
FUNCTION: HYDROLYSES BOTH CARBOXYMETHYLCELLULOSE AND XYLAN.
PROBABLY HAS A ROLE IN HYDROLYSING OLIGOSACCHARIDES DERIVED
FROM CELLULOSE, WHICH ARE TRANSPORTED ACROSS THE CELL WALL.
CATALYTIC ACTIVITY: Endohydrolysis of 1,4-beta-D-glucosidic
 SUBCELLULAR LOCATION:
 linkages in cellulose.
CATALYTIC ACTIVITY: Endohydrolysis of

 linkages in cellulose.

BIOTECHNOLOGY: Used as a detergent cellulase. Sold under the name Celluzyme by Novozymes. This special enzyme has three effects: colour brightening, softening and removal of particulate soil. The overall effect is that it helps to preserve the nice appearance of new fabric and restores old fabric so that it looks new again.

SIMILARITY: BELONGS TO CELLULASE FAMILY A (FAMILY 5 OF GLYCOSYL
 SIMILARITY:
 HYDROLASES).

 of endoglucanase III from Trichoderma reesei.";
FEBS Lett. 316:137-140(1993).
-I- FUNCTION: THE BIOLOGICAL CONVERSION OF CELLULOSE TO GLUCOSE
GENERALLY REQUIRES THREE TYPES OF HYDROLYTIC ENZYMES:
(1) ENDOGLUCANASES WHICH CUT INTERNAL BETA-1,4-GLUCOSIDIC BONDS;
(2) EXOCELLOBIOHYDROLASES THAT CUT THE DISSACCHARIDE CELLOBIOSE
FROM THE NONREDUCING END OF THE CELLULOSE POLYMER CHAIN;
(3) BETA-1,4-GLUCOSIDASES WHICH HYDROLYZE THE CELLLOBIOSE AND OTHER
SHORT CELLO-OLIGOSACCHARIDES TO GLUCOSE.
-I- CATALYTIC ACTIVITY: Endohydrolysis of 1,4-beta-D-glucosidic
 MEDLINE-88255850; PubMed-3384334; Saloheimo M., Lehtovaara P., Penttilae M., Te Johansson G., Pettersson G., Cyssens M., To "EGIII, a new endoglucanase from Trichoderma characterization of both gene and enzyme."; Gene 63:11-21(1988).

 can hydrolyze the glycosidic linkages in polysaccharides such as cellulose. The enzyme is also useful in a number of industrial applications where breaking down blomass is beneficial. Cellulase is also useful as a supplement in animal feed to decrease the production of fecal waste by increasing the digestibility of the feed. Cellulase is also useful to increase the efficiency of alcoholic fermentations by converting undigestible blomass into fermentable sugars. The present sequence represents a partial eglA polypeptide.
 The invention relates to a cellulase enzyme, eglA, isolated from the fungus piromyces rhizinflata. The eglA polypeptide hydrolyzes a polysaccharide containing a beta-1,3' or beta-1,4' glycosidic linkage. The eglA polynucleotide is useful for producing cellulase enzymes that

 Clone pCNP4.1 encodes celD. It was derived as follows. N. patriclarum was used to construct a cDNA library in ZAPII (in E. coll). Transformants were selected for enzyme activity using selective media. Il colonies were positive, and of these 10 had the same restriction pattern, and the longest of these was designated celD (pCNP4.1)(AAQ55036)(AAR47496,R49102). A similar process was used to isolate the xylanase clone pNX-Tac (AAQ55037,R47497). An enzyme composition contg. celD and xylanase is claimed.
 mRNA from culture, converting to enzymes useful in food processing rumen or silage bacteria
 Cloning of cellulase clones from anaerobic rumen - by isolati mRNA from culture, converting to cDNA etc. fungi, producing enzymes useful in food processing etc., and DNA for modifying

 This polypeptide comprises cellulase celB of Orpinomyces sp. strain OC-2, an anaerobic bovine rumen fungus Orpinomyces sp. PC-2. Its amino acid sequence was deduced from an isolated cDNA clone (see AAV29477). CelB has celloblohydrolase activity, with highest activity at pH 5.2-6.2 and 50 degC. CelA (see AAW55738) and celC (see AAW56739) cellulolytic enzymes of Orpinomyces sp. PC-2 are alsoprovided. Recombinant DNA molecules encoding Orpinomyces cellulase
 provided. Recombinant DNA molecules envuling or recombinant cells selected proteins are claimed, as well as recombinant cells selected proteins are claimed, as well as recombinant cells selected proteins are claimed or Facility.

 A cellulase (AAW14596) is encoded by a CDNA clone (AAT63043) derived from Aspergillus niger N400 (CBS120.49). The CDNA clone was isolated using a method for identifying a DNA fragment encoding a protein of interest. The method involves the direct screening of a CDNA library prepd. in bacteria (e.g. E. coli) transformed with DNA from a eukaryotic organism (e.g. A. niger) that produces the protein. Screening for cellulase-producing clones can be performed on plates containing CM-cellulase and Congo Red. The method was utilized in the identification of CDNA clones (AAT63042-46) coding for the containing CM-cellulase and Congo Red.

 EGI and EGII enzymes have catalytic core domains useful for reducing dye redeposition (backstaining) on cellulose-contg. fabrics such as denim, whilst maintaining or increasing abrasion during stonewashing. Truncated enzymes comprising these catalytic core domains can be obtoby proteolysis of the complete enzyme or by inserting the appropriate DNA fragment into a vector, using this to transform a Trichoderma sp. host cell, and recovering the recombinant core domain.
 The amino acid sequences for Trichoderma longibrachiatum cellobiohydrolase I (CBH) (AAW02022), CBHI (AAW02025), endoglucanase (EGI) (AAW02029), EGII (AAW02032) and EGIII (AAW02034) were deduced from the respective genomic DNA sequences (AAT32220-24). The CBHI, CBHII,

 The present sequence represents a cellulase enzyme SCE-3. 7 cellulase is used in the methods of the invention for treat of cellulose-containing fibres, for bleaching denim-dyed cellulose-containing fibres, for eliminating fluffs from cellulose-containing fibres, for weight loss treatment of cellulose-containing fibres and of deacetylated triacetate rayon, all by contacting the preparation with such fibres. It is useful in the textile and related industries.
 AAR79540 standard; Protein; 418
 Cellulose preparation containing highly active cellulase SCE3 - e.g. in treating cellulose-containing fibres to enable fluff elimination, weight loss and bleaching, and in weight loss treatment of deacetylated tri:acetate rayon

 - Web: www.genoscope.cns.fr)
Determination of this BAC-end sequence was carried out as part of a collaboration with the European Drosophila Genome Project (EDGP) - http://www.edgp.ebi.ac.uk -. This Drosophila melanogaster BAC library (Dros BAC) was made by Alain Billaud at CEPH (Centre d'Etude du Polymorphisme Humain) with funding provided by a MRC project grant. The DNA was prepared from embryos by Alain Bucheton and Genevieve Payan. It has been constructed in the vector
 GSS.
 Submitted (23-JUL-1999) Genoscope - Centre National de Sequencage : BP 191 91006 EVRY cedex - FRANCE (E-mail : seqref@genoscope.cns.fr

 Determination of this BAC-end sequence was carried out as part of a collaboration with the Berkeley Drosophila Genome Project (BDGP). The BDGP is constructing a physical map of the Drosophila melanogaster genome using these BACs. For further information please see http://www.fruitfly.org The BDGP Drosophila melanogaster BAC library was prepared by Kazutoyo Osoegawa and Aaron Mammoser in Pieter de Jong's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Institute in Buffalo, NY. The library is named RPCI-98 and was constructed by partial ECORI digestion of Drosophila DNA provided by the BDGP from the 1sogenic strain y2; cn bw sp, the same strain used for the BDGP's Pl and EST libraries. A more detailed description of the library and how to order individual BAC clones, the entire library, or filters for hybridization from the BACACR Resource Center can be found at http://bacacram.mad hiffalm.edu/Jacocchiis.

 Determination of this BAC-end sequence was carried out as part of a collaboration with the Berkeley Drosophila Genome Project (BDGP). The BDGP is constructing a physical map of the Drosophila melanogaster genome using these BACs. For further information please see http://www.fruitfly.org The BDGP Drosophila melanogaster BAC library was prepared by Kazutoyo Osoegawa and Aaron Mammoser in Pieter de Jong's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Institute in Buffalo, NY. The library is named RPCI-98 and was constructed by partial ECORI digestion of Drosophila DNA provided by the BDGP from the isogenic strain v2; cn bw sp, the same strain used for the BDGP's Pl and EST libraries. A more detailed description of the library and how to order individual BAC clones, the entire library, or filters for hybridization from the BACPAC Resource Center can be

 is used: (1) for diagnosis and/or prognosis of side effects of therapeutic drugs and of a wide range of diseases, e.g. cancer, disorders of the central nervous, cardiovascular, gastrointestinal and respiratory systems etc., particularly by detecting mutations or single nucleotide polymorphisms (SNP's); and (11) for differentiation of cell or tissue types and for investigating cell differentiation. The method allows the methylation status of many C residues to be determined simultaneously. AB013410-AB054121 represent genomic DNA sequences used to illustrate the method for determining the degree of cytosine methylation described in
 This invention describes a novel method for determining the degree of methylation of a particular cytosine in a motif 5'-CpG-3', present in a genomic sample of DNA. The sample is treated chemically to convert cytosine (C) but not methylated C, to uracil, then part of the genomic DNA that contains the target C is amplified to form a labeled amplicon. The amplicon is hybridised to two classes, each with at least one member, of oligonucleotides and/or peptide-nucleic acid (PNA) oligomers and the degree of hybridisation to both classes is determined from the label on the amplicon. From the ratio of labels hybridised to the two classes of oligomers, the degree of methylation is calculated. The meth is used: (1) for diagnosis and/or prognosis of side effects of

CTACGTCTACATCAACATCTACGTCGACGTCTACATCTACGTCGACGTCGACGT

genomic sample of DNA. The sample is treated chemically to convert cytosine (C) but not methylated C, to uracil, then part of the genomic DNA that contains the target C is amplified to form a labeled amplicon. The amplicon is hybridised to two classes, each with at least one member, of oligonucleotides and/or peptide-nucleic acid (PNA) oligomers and the degree of hybridisation to both classes is determined from the label on the amplicon. From the ratio of labels hybridised to the two classes of oligomers, the degree of methylation is calculated. The method is used: (i) for diagnosis and/or prognosis of side effects of the central nervous, cardiovascular, gastrointestinal and respiratory. systems etc., particularly by detecting mutations or single nucleotide polymorphisms (SNP's); and (ii) for differentiation of cell or tissue types and for investigating cell differentiation. The method allows the methylation status of many C residues to be determined simultaneously. ABQ13410-ABQ54121 represent genomic DNA sequences used to illustrate the method for determining the degree of cytosine methylation described in the disclosure of the invention.

 The invention relates to a beta-glucanase polypeptide obtainable from a fungus of the genus Talaromyces, e.g. T.emersonii, having endoglucanase activity (EC 3.2.1.4). Beta-glucanase polypeptide is useful for the manufacture of a medicament for treating hyperlipaemia, high serum cholesterol and triglyceride levels. Beta-glucanase polypeptide are useful for treating fungal or plant materials (plant pulp, plant extracts), edible foodstuffs or ingredients, or fabrics, textiles or clothes containing plant materials. Beta-glucanase polypeptide is useful for reducing the viscosity of a plant material, for cleaving beta-glucan polymers in the plant material, and for processing plant pulp, juice or extract, by incubating the pulp, juice or extract. Beta-glucanase polypeptide is applicable in brewing, distilling, blomethanation, dental hygiene, leather-treatment, paper manufacture, treatment treatment and for processing plant processing plant beta-glucanase polypeptide is applicable in brewing, distilling, blomethanation, dental hygiene, leather-treatment, paper manufacture, treatment and for processing plant
 textile treatment or manufacture, baking or bread making, washing or detergent treatment, treating flower bulbs or in animal feed. Beta-glucanase polypeptide is also useful during the production of milk substituted from soybean. The present sequence is Talaromyces emersonii
 New polypeptide for treating hyperlipemia and/or high serum cholesterol and triglyceride levels, comprises the beta-glucanase protein obtainable from Talaromyces fungus -

 adapt to changes in culture conditions, environmental stress, spore morphogenesis, recombination, metabolic or catabolic pathway engineering. Using ESTs provides several advantages over genomic or random cDNA clones including elimination of redundancy as one spot on an array equals one gene or open reading frame, and organisation of the microarrays based on function of the gene products to facilitate analysis of the results. AAF07478 to AAF11247 represents ESTs from Aspergillus niger; AAF11854 to AAF114878 represents ESTs from Aspergillus oryzae, and AAF14879 to AAF15337 represents ESTs from Trichoderma reesei, which are
 the FF cells and a substrate of expressed sequence tags (EST). The ESTS are used in the methods for monitoring differential expression of genes in a first filamentous fungal (FF) cell relative to expression of the same genes in one or more second filamentous fungal cells. Monitoring the global expression of genes from FF cells allows the production
 1018
 potential of the microorganisms to be improved. New genes may be discovered, possible functions of unknown open reading frames can be identified and gene copy number variation and stability can be monitored. The expression of genes can be used to study how FF cells
 expression cells. The
 Monitoring differential expression of genes in filamentous fungal uses fluorescence-labeled nucleic acids isolated from the cells are substrate of expressed sequence tags -

 expression of genes in a first filamentous fungal (FF) cell relative texpression of the same genes in one or more second filamentous fungal cells. The method uses filorescence-labeled nucleic acids isolated from the FF cells and a substrate of expressed sequence tags (EST). The EST are used in the methods for monitoring differential expression of gene in a first filamentous fungal (FF) cell relative to expression of the same genes in one or more second filamentous fungal cells. Monitoring the global expression of genes from FF cells allows the production potential of the microorganisms to be improved. New genes may be discovered, possible functions of unknown open reading frames can be identified and gene copy number variation and stability can be monitored. The expression of genes can be used to study how FF cells again to changes in output productions of genes can be used to study how FF cells
 Fusarium venenatum; AAF11248 to AAF11853 represents ESTs from Aspergilliniter AAF11854 to AAF14878 represents ESTs from Aspergillus oryzae; and AAF14879 to AAF1337 represents ESTs from Trichoderma reesei, which are all specifically claimed in the present invention.
 adapt to changes in culture conditions, environmental stress, spore morphogenesis, recombination, metabolic or catabolic pathway engineering. Using ESTs provides several advantages over genomic or random cDNA clones including elimination of redundancy as one spot carray equals one gene or open reading frame, and organisation of the microarrays based on function of the gene products to facilitate analysis of the results, AAFO7478 to AAFI1247 represents ESTs from

 digestibility of the feed. The feed-additive enables a conventional cereal-based feed to by modified by reducing its energy, protein and/or amino acid content while simultaneously maintaining the same nutritional levels of energy, protein and amino acids available to the animal. The feed-additive also
 Endoglucanase-II (EG-II) is used in an animal feed-additive to produce a cereal-based animal feed, especially for fowl. EG-II may be produced recombinantly, optionally without the cellulose-binding domain. The feed-additive can be incorporated

 The invention relates to a cellulase preparation comprising a transconjugant-originated endoglucanse and a non-ionic surfactant. The endoglucanse is selected from RCEI, RCEII, RCEII, MCEI, MCEII or PCEI proteins. The preparations are useful in detergent compositions, in treating cellulose fibers and deinking waste paper and improving the freeness of paper pulp. The fibers treated by the preparations have reduced feathering and improved skin-feel and appearance with colour clarification, local change in colour and softening, and after deinking and paper pulp treatment, there is an improvement on freeness of the paper pulp. This treatment with the cellulase preparation can be operated at significantly lower cost. The present sequence represents the

 The present sequence encodes a cellulase enzyme SCE-3. The is used in the methods of the invention for treatment of cellulose-containing fibres, for bleaching denim-dyed cellulose-containing fibres, for eliminating fluffs from cellulose-containing fibres, for weight loss treatment of cellulose-containing fibres and of deacetylated triacetate rayon, all by contacting the preparation with such fibres. It is useful in the textile and related industries.

 of cellulase preparations comprising an endoglucanase with a cellulose binding domain (CBD) and one or more terephthalic acid-alkylene glycol copolymer or terephthalic acid-oligoalkylene glycol copolymer. The glycol copolymer is of a formula given in the specification. The detergent compositions provide smooth removal of dirt. The detergent compositions of the invention are used for treatment of textiles for colour clarification, removal of feathers or improvement of texture to give a stone washed appearance. The present sequence represents a Trichoderma viride gene sequence, which is used in the course of the invention.
 Detergent compositions, useful for treatment of textiles, e.g. colclarification, comprise cellulase preparations with endoglucanase terephthalic acid-alkylene glycol copolymer or terephthalic

 The present sequence appears in the specification. The specification describes a new regulatory sequence for Trichoderma viride derived cellulase cbhl gene and the establishment of a system for mass producing cellulase in moulds such as T. viride. As the regulatory sequence of cbhl genes originating in T. viride can highly express objective
 obhl genes originating in T. viride can highly express objective proteins, proteins such as cellulase can be expressed. An expression vector containing the regulatory sequence and Humicola insolens derived endo-glucanase NCE4 DNA was produced, and used to produce endo-glucanase
 Sequence 1463 BP;

Pred. No.

is the number of results predicted by chance to have a

expression and promoter analysis

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
